A TASTE OF ITALY'S FINEST WINERIES

Embedded into a natural landscape steeped in tradition, these selected winery designs offer a dynamic outlook towards the future of the industry while eloquently achieving a state of balance between humans and the environment.

Some of the architectural elements and materials in common between these different designs include arches of brick and the use of traditional sandstone and limestone offset against modern materials such as Cor-ten. Another modern element featured throughout these projects is the use of glazing, which allows the light and colours of the vineyard - from deep browns and burgundies to vibrant greens - to flow from the outside in.

These wineries also cleverly accommodate complex programmes including barrel, wine and vat cellars along with primary and secondary processing areas, water reserves, oenological products, warehouses for cleaning barrels to name a few.

The Winery Bulgari in Tuscany for example features a central space with a height of +6.10 meters that accommodates a series of interstitial zones amongst the main production spaces, staff changing rooms, mechanical rooms and laboratories. At a similar height of 5.30 m above the fermentation areas, a wine tasting room overlooks the complex programme and internal machinery that goes into world class winery. Large panels of glass used this winery and others such as Di Sipioin particular allow for visibility into the multitude of different functional areas from working to storage areas, thus connecting the many different programs together.

The Winery Nals Margreid also takes an interesting design approach to accommodating the functional elements of a winery. Strikingly, the barrel cellar is placed into the court like an oversized case of wine. This barrel cellar is constructed in wood, naturally.

Moving beyond the functional, these wineries are also places of relaxation for people, incorporating guest houses, landscape gardens, spas and in the case of Le Monde Garden, a particularly luxurious pool and sun shaded veranda.

These mutually held qualities between these different project bring meaning not only to the architecture but also a harmonious note to the world of wine.
